Web-Development Course Project:

“Cinematon Booking Web App”.

Made by:
Frolov Yevgeniy
Nurbek Tazhenov
Dias Mukashev

Short Idea and Description:

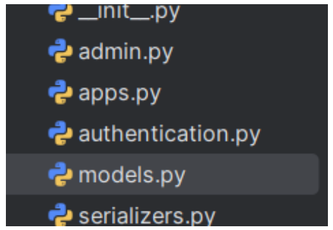
We tried to develop web-site/app which will be useful to book tickets to Cinema.

We wanted to make client feel comfortable and give at least basic abilities of professional web-site/app.

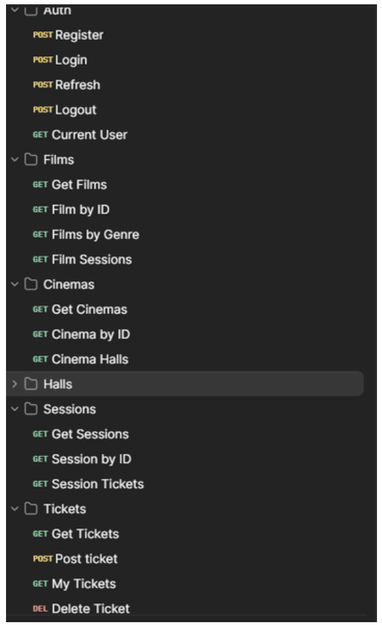
We were greatly looking towards kino.kz web-site and their app

What we have done in Django:

We have done models, erializers and custom auth to mplement cookies alongside with JWT tokens:

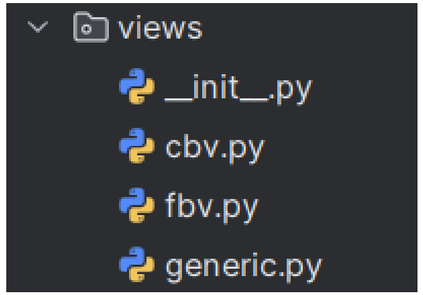


We tested all required endpoints, our web app fully use only one CRUD out of 6 - tickets



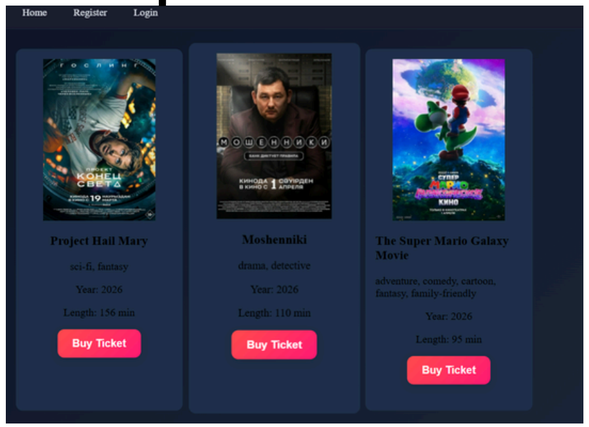
We configured CORS and changed host to localhost

We made fbv and CBV using @api_view and ApiView.

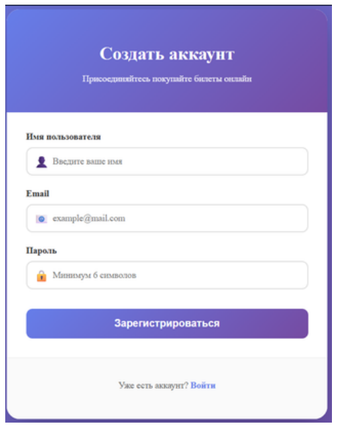


What we have done in Angular

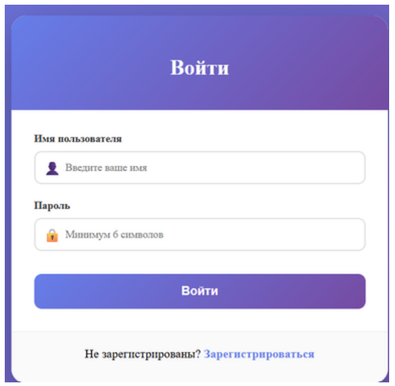
Home page with independent navbar



Register page

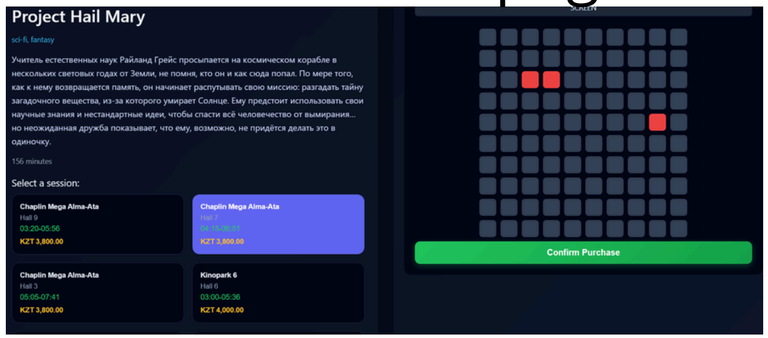


Login page



Profile page

Film detail page and booking tickets subpage



We implemented all requirements from the list. Although, http error handling is quite different from expected, because we decided to show custom messages or UI components instead of throwing HTTP errors into user.
